Abstract

This specification (WS-ReliableMessaging) describes a protocol that allows messages to be delivered reliably between distributed applications in the presence of software component, system, or network failures. The protocol is described in this specification in a transport-independent manner allowing it to be implemented using different network technologies. To support interoperable Web services, a SOAP binding is defined within this specification.

The protocol defined in this specification depends upon other Web services specifications for the identification of service endpoint addresses and policies. How these are identified and retrieved are detailed within those specifications and are out of scope for this document.

Composable Architecture

By using the SOAP [SOAP] and WSDL [WSDL] extensibility model, SOAP-based and WSDL-based specifications are designed to be composed with each other to define a rich Web services environment. As such, WS-ReliableMessaging by itself does not define all the features required for a complete messaging solution. WS-ReliableMessaging is a building block that is used in conjunction with other specifications and application-specific protocols to accommodate a wide variety of protocols related to the operation of distributed Web services.

Status

WS-ReliableMessaging and related specifications are provided for use as-is and for review and evaluation only. BEA, IBM, Microsoft, and TIBCO Software will solicit your contributions and suggestions in the near future. BEA, IBM, Microsoft, and TIBCO Software make no warrantees or representations regarding the specification in any manner whatsoever.

We wish to thank the participants of the WS-ReliableMessaging Feedback and Interop Workshops for their valuable feedback.

We also wish to thank the technical writers and development reviewers who provided feedback to improve the readability of the specification.

1. Introduction

It is often a requirement for two Web services that wish to communicate to do so reliably in the presence of software component, system, or network failures. The primary goal of this specification is to create a modular mechanism for reliable message delivery. It defines a messaging protocol to identify, track, and manage the reliable delivery of messages between exactly two parties, a source and a destination. It also defines a SOAP binding that is required for interoperability. Additional bindings may be defined.

This mechanism is extensible allowing additional functionality, such as security, to be tightly integrated. This specification integrates with and complements the WS-Security, WS-Policy, and other Web services specifications. Combined, these allow for a broad range of reliable, secure messaging options.

1.1 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC2119 [KEYWORDS].

Namespace URIs of the general form "some-URI" represents some application-dependent or context-dependent URI as defined in RFC2396 [URI].

This specification uses an informal syntax to describe the XML grammar of the XML fragments below:

- The syntax appears as an XML instance, but the values indicate the data types instead of values.
- Element names ending in "..." (such as `<element.../>` or `<element...>`) indicate that attributes irrelevant to the context are being omitted.
- Element content ending in "..." indicates that elements irrelevant to the context are being omitted.
- Grammar in bold has not been introduced earlier in the document, or is of particular interest in an example.
- Characters are appended to elements and attributes as follows: "|", (choice), "?" (0 or 1), "*" (0 or more), "+" (1 or more). The characters "[" and "]" are used to indicate that contained items are to be treated as a group with respect to the "|", "?", "*", or "+" characters.
- The XML namespace prefixes (defined below) are used to indicate the namespace of the element being defined.
- Examples starting with `<?xml>` contain enough information to conform to this specification; others examples are fragments and require additional information to be specified in order to conform.

XSD schemas and WSDL definitions are provided as a formal definition of grammars [xml-schema1] [WSDL].

1.2 Namespace

The XML namespace [XML-ns] URI that MUST be used by implementations of this specification is:

```
http://schemas.xmlsoap.org/ws/2005/02/rm
```

The namespace prefix "wsrm" used in this specification is associated with this URI.

The following namespaces are used in this document:

Prefix	Namespace
S	http://www.w3.org/2003/05/soap-envelope

S11	http://schemas.xmlsoap.org/soap/envelope/
wsrm	http://schemas.xmlsoap.org/ws/2005/02/rm
wsa	http://schemas.xmlsoap.org/ws/2004/08/addressing
wsse	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd

The normative schema for WS-Reliable Messaging can be found at:

http://schemas.xmlsoap.org/ws/2005/02/rm/wsrm.xsd

All sections explicitly noted as examples are informational and are not to be considered normative.

If an action URI is used, and one is not already defined per the rules of the WS-Addressing specification [WS-Addressing], then the action URI MUST consist of the reliable messaging namespace URI concatenated with the "/" character and the element name. For example:

```
http://schemas.xmlsoap.org/ws/2005/02/rm/SequenceAcknowledgement
```

2. Reliable Messaging Model

Many errors may interrupt a conversation. Messages may be lost, duplicated or reordered. Further the host systems may experience failures and lose volatile state.

WS-ReliableMessaging provides an interoperable protocol that a Reliable Messaging (RM) Source and Reliable Messaging (RM) Destination use to provide Application Source and Destination a guarantee that a message that is sent will be delivered. The guarantee is specified as a delivery assurance. The protocol supports the endpoints in providing these delivery assurances. It is the responsibility of the RM Source and RM Destination to fulfill the delivery assurances, or raise an error. The protocol defined here allows endpoints to meet this guarantee for the delivery assurances defined below.

Persistence considerations related to an endpoint's ability to satisfy the delivery assurances defined below are the responsibility of the implementation and do not affect the wire protocol. As such, they are out of scope of this specification.

There are four basic delivery assurances that endpoints can provide:

AtMostOnce Messages will be delivered at most once without duplication or an error will be raised on at least one endpoint. It is possible that some messages in a sequence may not be delivered.

AtLeastOnce Every message sent will be delivered or an error will be raised on at least one endpoint. Some messages may be delivered more than once.

ExactlyOnce Every message sent will be delivered without duplication or an error will be raised on at least one endpoint. This delivery assurance is the logical "and" of the two prior delivery assurances.

InOrder Messages will be delivered in the order that they were sent. This delivery assurance may be combined with any of the above delivery assurances. It requires that the sequence observed by the ultimate receiver be non-decreasing. It says nothing about duplications or omissions.

The diagram below illustrates the entities and events in a simple reliable message exchange. First, the Application Source Sends a message for reliable delivery. The Reliable Messaging (RM) Source accepts the message and Transmits it one or more times. After receiving the message, the RM Destination Acknowledges it. Finally, the RM Destination delivers the message to the Application Destination. The exact roles the entities play and the complete meaning of the events will be defined throughout this specification.

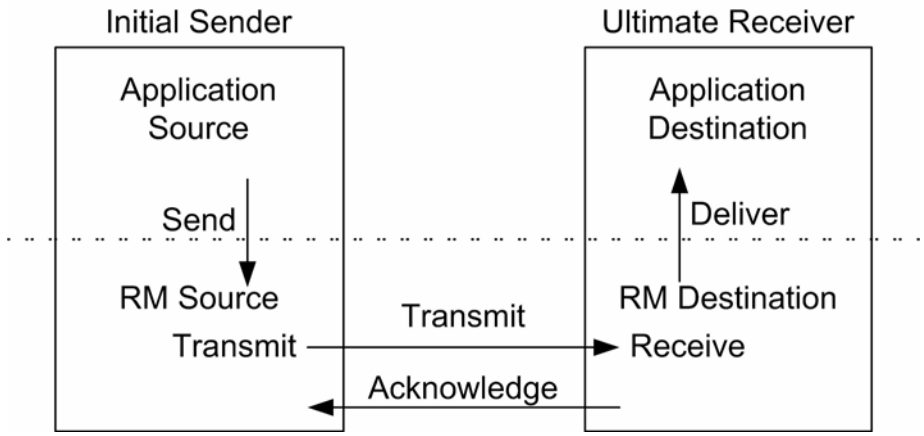

Figure 1: Reliable Messaging Model

2.1 Glossary

The following definitions are used throughout this specification:

Endpoint: A referencable entity, processor, or resource where Web service messages are originated or targeted.

Application Source: The endpoint that Sends a message.

Application Destination: The endpoint to which a message is Delivered.

Delivery Assurance: The guarantee that the messaging infrastructure provides on the delivery of a message.

RM Source: The endpoint that transmits the message.

RM Destination: The endpoint that receives the message.

Send: The act of submitting a message to the RM Source for reliable delivery. The reliability guarantee begins at this point.

Deliver: The act of transferring a message from the RM Destination to the Application Destination. The reliability guarantee is fulfilled at this point.

Transmit: The act of writing a message to a network connection.

Receive: The act of reading a message from a network connection.

Acknowledgement: The communication from the RM Destination to the RM Source indicating the successful receipt of a message.

2.2 Protocol Preconditions

The correct operation of the protocol requires that a number of preconditions MUST be established prior to the processing of the initial sequenced message:

- The RM Source MUST have an endpoint reference that uniquely identifies the RM Destination endpoint; correlations across messages addressed to the unique endpoint MUST be meaningful.
- The RM Source MUST have knowledge of the destination's policies, if any, and the RM Source MUST be capable of formulating messages that adhere to this policy.
- If a secure exchange of messages is required, then the RM Source and RM Destination MUST have a security context.

2.3 Protocol Invariants

During the lifetime of the protocol, two invariants are REQUIRED for correctness:

- The RM Source MUST assign each reliable message a sequence number (defined below) beginning at 1 and increasing by exactly 1 for each subsequent reliable message.
- Every acknowledgement issued by the RM Destination MUST include within an acknowledgement range or ranges the sequence number of every message successfully received by the RM Destination and MUST exclude sequence numbers of any messages not yet received.

2.4 Example Message Exchange

The following figure illustrates a possible message exchange between two reliable messaging endpoints.

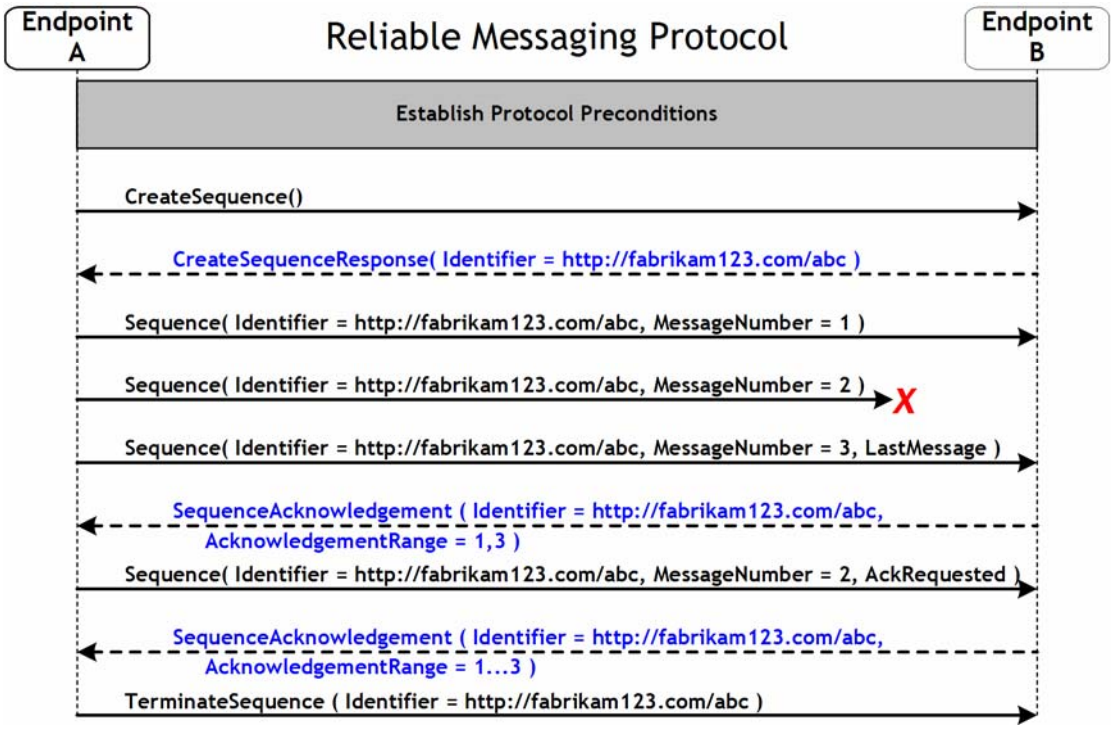

Figure 2: The WS-ReliableMessaging Protocol

1. The protocol preconditions are established. These include policy exchange, endpoint resolution, establishing trust.
2. The RM Source requests creation of a new Sequence.
3. The RM Destination creates a Sequence by returning a globally unique identifier.
4. The RM Source begins sending messages beginning with MessageNumber 1. In the figure the RM Source sends 3 messages.
5. Since the 3rd message is the last in this exchange, the RM Source includes a <LastMessage> token.
6. The 2nd message is lost in transit.
7. The RM Destination acknowledges receipt of message numbers 1 and 3 in response to the RM Source's <LastMessage> token.
8. The RM Source retransmits the 2nd message. This is a new message on the underlying transport, but since it has the same sequence identifier and message number so the RM Destination can recognize it as equivalent to the earlier message, in case both are received.
9. The RM Source includes an <AckRequested> element so the RM Destination will expedite an acknowledgement.
10. The RM Destination receives the second transmission of the message with MessageNumber 2 and acknowledges receipt of message numbers 1, 2, and 3 which carried the <LastMessage> token.
11. The RM Source receives this acknowledgement and sends a TerminateSequence message to the RM Destination indicating that the sequence is completed and reclaims any resources associated with the Sequence.
12. The RM Destination receives the TerminateSequence message indicating that the RM Source will not be sending any more messages, and reclaims any resources associated with the Sequence.

Now that the basic model has been outlined, the details of the elements used in this protocol are now provided.

3. RM Protocol Elements

The protocol elements define extensibility points at various places. Additional children and/or attributes MAY be added at the indicated extension points but MUST NOT contradict the semantics of the parent and/or owner, respectively. If a receiver does not recognize an extension, the receiver SHOULD ignore the extension.

3.1 Sequences

The RM protocol uses a <Sequence> header block to track and manage the reliable delivery of messages. Messages for which the delivery assurance applies MUST contain a <Sequence> header block. Each Sequence MUST have a unique <Identifier> element and each message within a Sequence MUST have a <MessageNumber> element that increments by 1 from an initial value of 1. These values are contained within a

<Sequence> header block accompanying each message being delivered in the context of a Sequence. In addition to mandatory <Identifier> and <MessageNumber> elements, the header MAY include a <LastMessage> element.

There MUST be no more than one <Sequence> header block in any message.

The purpose of the <LastMessage> element is to signal to the RM Destination that the message represents the last message in the Sequence.

A following exemplar defines its syntax:

```
<wsrm:Sequence ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    <wsrm:MessageNumber> xs:unsignedLong </wsrm:MessageNumber>
    <wsrm:LastMessage/>?
    ...
</wsrm:Sequence>
```

The following describes the content model of the Sequence header block.

/wsrm:Sequence
: This is the element containing Sequence information for WS-ReliableMessaging. The <wsrm:Sequence> element MUST be understood by the RM Destination. The <wsrm:Sequence> element MUST have a mustUnderstand attribute from the namespace corresponding to the version of SOAP to which the <wsrm:Sequence> SOAP header block is bound.

/wsrm:Sequence/wsrm:Identifier
: This required element MUST contain an absolute URI conformant with RFC2396 that uniquely identifies the Sequence.

/wsrm:Sequence/wsrm:Identifier/@{any}
: This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:Sequence/wsrm:MessageNumber
: This required element MUST contain an unsignedLong representing the ordinal position of the message within a Sequence. Sequence MessageNumbers start at 1 and monotonically increase throughout the Sequence. If the message number exceeds the internal limitations of an RM Source or RM Destination or reaches the maximum value of an unsignedLong (18,446,744,073,709,551,615), the RM Source or Destination MUST issue a MessageNumberRollover fault.

/wsrm:Sequence/wsrm:LastMessage
: This element MAY be included by the RM Source endpoint. The <LastMessage> element has no content.

/wsrm:Sequence/{any}
: This is an extensibility mechanism to allow different types of information, based on a schema, to be passed.

/wsrm:Sequence/@{any}
: This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

A RM Source endpoint MUST include a <LastMessage> element in the <Sequence> element for the last message in a Sequence. An RM Destination endpoint MUST respond with a <SequenceAcknowledgement> upon receipt of a <LastMessage> element. A Sequence MUST NOT use a <MessageNumber> value greater than that which accompanies a <LastMessage> element. An RM Destination MUST generate a LastMessageNumberExceeded fault upon receipt of such a message. In the event that an RM Source needs to close a Sequence and there is no application message, the RM Source MAY send a message with an empty body containing <Sequence> header with the <LastMessage> element. In this usage, the action URI MUST be:

```
http://schemas.xmlsoap.org/ws/2005/02/rm/LastMessage
```

in preference to the pattern defined in Section 1.2.

The following example illustrates a Sequence header block.

```
<wsrm:Sequence>
   <wsrm:Identifier>http://fabrikam123.com/abc</wsrm:Identifier>
   <wsrm:MessageNumber>10</wsrm:MessageNumber>
   <wsrm:LastMessage/>
</wsrm:Sequence>
```

3.2 Sequence Acknowledgement

The RM Destination informs the RM Source of successful message receipt using a <SequenceAcknowledgement> header block. The <SequenceAcknowledgement> header block MAY be transmitted independently or included on return messages. The RM Destination MAY send a <SequenceAcknowledgement> header block at any point. The timing of acknowledgements can be advertised using policy and acknowledgements can be explicitly requested using the <AckRequested> directive.

The following exemplar defines its syntax:

```
<wsrm:SequenceAcknowledgement ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    [ <wsrm:AcknowledgementRange ...
        Upper="xs:unsignedLong"
        Lower="xs:unsignedLong"/> +
    | <wsrm:Nack> xs:unsignedLong </wsrm:Nack> + ]
    ...
</wsrm:SequenceAcknowledgement>
```

The following describes the content model of the <SequenceAcknowledgement> header block.

/wsrm:SequenceAcknowledgement
: This element contains the Sequence acknowledgement information.

/wsrm:SequenceAcknowledgement/wsrm:Identifier
: This required element MUST contain an absolute URI conformant with RFC2396 that uniquely identifies the Sequence.

/wsrm:SequenceAcknowledgement/wsrm:Identifier/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange
This optional element, if present, can occur 1 or more times. It contains a range of message Sequence MessageNumbers successfully received by the receiving endpoint manager. The ranges SHOULD NOT overlap. This element MUST NOT be present if <Nack> is also present as a child of <SequenceAcknowledgement>.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Upper
This required attribute contains an unsignedLong representing the <MessageNumber> of the highest contiguous message in a Sequence range.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@Lower
This required attribute contains an unsignedLong representing the <MessageNumber> of the lowest contiguous message in a Sequence range.

/wsrm:SequenceAcknowledgement/wsrm:AcknowledgementRange/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:SequenceAcknowledgement/wsrm:Nack
This optional element, if present, MUST contain an unsignedLong representing the <MessageNumber> of an unreceived message in a Sequence. This element MUST NOT be present if the <AcknowledgementRange> is also present as a child of <SequenceAcknowledgement>. The <Nack> element permits the gap analysis of the <AcknowledgementRange> elements to be performed at the RM Destination rather than at the RM Source which may yield performance benefits in certain environments.

/wsrm:SequenceAcknowledgement/{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:SequenceAcknowledgement/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

The following examples illustrate <SequenceAcknowledgement> elements:

- Message numbers 1...10 inclusive in a Sequence have been received by the RM Destination.

```
<wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://fabrikam123.com/abc</wsrm:Identifier>
   <wsrm:AcknowledgementRange Upper="10" Lower="1"/>
</wsrm:SequenceAcknowledgement>
```

- Message numbers 1..2, 4..6, and 8..10 inclusive in a Sequence have been received by the RM Destination, messages 3 and 7 have not been received.

```
<wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://fabrikam123.com/abc</wsrm:Identifier>
```

```
   <wsrm:AcknowledgementRange Upper="2" Lower="1"/>
   <wsrm:AcknowledgementRange Upper="6" Lower="4"/>
   <wsrm:AcknowledgementRange Upper="10" Lower="8"/>
</wsrm:SequenceAcknowledgement>
```

- Message number 3 in a Sequence has not been received by the RM Destination.

```
<wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://fabrikam123.com/abc</wsrm:Identifier>
   <wsrm:Nack>3</wsrm:Nack>
</wsrm:SequenceAcknowledgement>
```

3.3 Request Acknowledgement

The purpose of the <AckRequested> header block is to signal to the RM Destination that the RM Source is requesting that a <SequenceAcknowledgement> be returned.

At any time, the RM Source may request an acknowledgement message from the RM Destination point using an <AckRequested> header block.

The RM Source endpoint requests this acknowledgement by including an <AckRequested> header block in the message. An RM Destination that receives a message that contains an <AckRequested> header block MUST respond with a message containing a <SequenceAcknowledgement> header block.

The following exemplar defines its syntax:

```
<wsrm:AckRequested ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    <wsrm:MessageNumber> xs:unsignedLong </wsrm:MessageNumber> ?
    ...
</wsrm:AckRequested>
```

/wsrm:AckRequested
: This element requests an acknowledgement for the identified sequence.

/wsrm:AckRequested/wsrm:Identifier
: This required element MUST contain an absolute URI, conformant with RFC2396, that uniquely identifies the Sequence to which the request applies.

/wsrm:AckRequested/wsrm:Identifier/@{any}
: This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:AckRequested/wsrm:MessageNumber
: This optional element, if present, MUST contain an xs:unsignedLong representing the highest <MessageNumber> sent by the RM Source within a Sequence. If present, it MAY be treated as a hint to the RM Destination as an optimization to the process of preparing to transmit a <SequenceAcknowledgement>.

/wsrm:AckRequested/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:AckRequested/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

3.4 Sequence Creation

The RM Source MUST request creation of an outbound Sequence by sending a <CreateSequence> element in the body of a message to the RM Destination which in turn responds either with a <CreateSequenceResponse> or a CreateSequenceRefused fault in the body of the response message. <CreateSequence> MAY carry an offer to create an inbound sequence which is either accepted or rejected in the <CreateSequenceResponse>.

The RM Destination of the outbound sequence is the WS-Addressing EndpointReference to which <CreateSequence> is sent. The RM Destination of the inbound sequence is the WS-Addressing <wsa:ReplyTo> of the <CreateSequence>.

The following exemplar defines the <CreateSequence> syntax:

```
<wsrm:CreateSequence ...>
    <wsrm:AcksTo ...> wsa:EndpointReferenceType </wsrm:AcksTo>
    <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
    <wsrm:Offer ...>
        <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
        <wsrm:Expires ...> xs:duration </wsrm:Expires> ?
        ...
    </wsrm:Offer> ?
    ...
    <wsse:SecurityTokenReference>
      ...
    </wsse:SecurityTokenReference> ?
    ...
</wsrm:CreateSequence>
```

/wsrm:CreateSequence

This element requests creation of a new Sequence between the RM Source that sends it, and the RM Destination to which it is sent. This element MUST NOT be sent as a header block. The RM Destination MUST respond either with a <CreateSequenceResponse> response message or a CreateSequenceRefused fault.

/wsrm:CreateSequence/wsrm:AcksTo

This required element, of type wsa:EndpointReferenceType as specified by WS-Addressing [WS-ADDR] specifies the endpoint reference to which

<SequenceAcknowledgement> messages and faults related to the created Sequence are to be sent.

/wsrm:CreateSequence/wsrm:Expires

This element, if present, of type xs:duration specifies the RM Source's requested duration for the Sequence. The RM Destination MAY either accept the requested duration or assign a lesser value of its choosing. A value of 'P0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'P0S'.

/wsrm:CreateSequence/wsrm:Expires/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer

This element, if present, enables an RM Source to offer a corresponding Sequence for the reliable exchange of messages transmitted from RM Destination to RM Source.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier

This required element MUST contain an absolute URI conformant with RFC2396 that uniquely identifies the offered Sequence.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Identifier/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Expires

This element, if present, of type xs:duration specifies the duration for the Sequence. A value of 'P0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'P0S'.

/wsrm:CreateSequence/wsrm:Offer/wsrm:Expires/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequence/wsrm:Offer/{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/wsrm:Offer/@{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/wsse:SecurityTokenReference
This optional element uses the extensibility mechanism defined next to communicate an explicit reference to the security token to be used to authorize messages for the created outbound Sequence and if offered the inbound Sequence, using a <wsse:SecurityTokenReference> as documented in WS-Security [WSSecurity]. All subsequent messages in the outbound Sequence and if offered the inbound Sequence MUST demonstrate proof-of-possession of the referenced key.

/wsrm:CreateSequence/{any}

This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequence/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

A <CreateSequenceResponse> is sent in the body of a response message by an RM Destination in response to receipt of a <CreateSequence> request message. It carries the <Identifier> of the created Sequence and indicates that the RM Source may begin sending messages in the context of the identified Sequence.

The following exemplar defines the <CreateSequenceResponse> syntax:

```
<wsrm:CreateSequenceResponse ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    <wsrm:Expires> xs:duration </wsrm:Expires> ?
    <wsrm:Accept ...>
        <wsrm:AcksTo ...> wsa:EndpointReferenceType </wsrm:AcksTo>
        ...
    </wsrm:Accept> ?
    ...
</wsrm:CreateSequenceResponse>
```

/wsrm:CreateSequenceResponse
This element is sent in the body of the response message in response to a <CreateSequence> request message. It indicates that the RM Destination has created a new Sequence at the request of the RM Source. This element MUST NOT be sent as a header block.

/wsrm:CreateSequenceResponse/wsrm:Identifier
This required element MUST contain an absolute URI conformant with RFC2396 of the Sequence that has been created by the RM Destination.

/wsrm:CreateSequenceResponse/wsrm:Identifier/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequenceResponse/wsrm:Expires
This element, if present, of type xs:duration accepts or refines the RM Source's requested duration for the Sequence. A value of 'P0S' indicates that the Sequence will never expire. Absence of the element indicates an implied value of 'P0S'. This value MUST be equal or lesser than the value requested by the RM Source in the corresponding <CreateSequence> message.

/wsrm:CreateSequenceResponse/wsrm:Expires/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:CreateSequenceResponse/wsrm:Accept
This element, if present, enables an RM Destination to accept the offer of a corresponding Sequence for the reliable exchange of messages transmitted from RM

Destination to RM Source. This element MUST be present if the corresponding <CreateSequence> message contained an <Offer> element.

/wsrm:CreateSequenceResponse/wsrm:Accept/wsrm:AcksTo
This required element, of type wsa:EndpointReferenceType as specified by WS-Addressing [WS-ADDR], specifies the endpoint reference to which <SequenceAcknowledgement> messages related to the accepted Sequence are to be sent.

/wsrm:CreateSequenceResponse/wsrm:Accept/{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/wsrm:Accept/@{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:CreateSequenceResponse/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

3.5 Sequence Termination

After an RM Source receives the <SequenceAcknowledgement> acknowledging the complete range of messages in a Sequence, it sends a <TerminateSequence> element, in the body of a message to the RM Destination to indicate that the Sequence is complete, and that it will not be sending any further messages related to the Sequence. The RM Destination can safely reclaim any resources associated with the Sequence upon receipt of the <TerminateSequence> message.

The following exemplar defines the TerminateSequence syntax:

```
<wsrm:TerminateSequence ...>
    <wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
    ...
</wsrm:TerminateSequence>
```

/wsrm:TerminateSequence
This element is sent by an RM Source after it has received the final <SequenceAcknowledgement> covering the full range of a Sequence. It indicates that the RM Destination can safely reclaim any resources related to the identified Sequence. This element MUST NOT be sent as a header block.

/wsrm:TerminateSequence/wsrm:Identifier
This required element MUST contain an absolute URI conformant with RFC2396 of the Sequence that is being terminated.

/wsrm:TerminateSequence/wsrm:Identifier/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

/wsrm:TerminateSequence/{any}
This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:TerminateSequence/@{any}
This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

4. Faults

The fault definitions defined in this section reference certain abstract properties, such as [fault endpoint], that are defined in section 3 of the WS-Addressing [WS-Addressing] specification. Endpoints compliant with this specification MUST include required message information headers on all fault messages.

Sequence creation uses a CreateSequence, CreateSequenceResponse request reply. Faults for this operation are treated as defined in WS-Addressing. CreateSequenceRefused is a possible fault reply for this operation. UnknownSequence is a fault generated by endpoints when messages carrying RM header blocks targeted at unrecognized sequences are detected, these faults are also treated as defined in WS-Addressing. All other faults in this section relate to the processing of RM header blocks targeted at known sequences and are collectively referred to as sequence faults. Sequence faults SHOULD be sent to the same [destination] as <SequenceAcknowledgement> messages. These faults are correlated using the sequence identifier carried in the detail.

WS-ReliableMessaging faults MUST include as the [action] property the default fault action URI defined in the version of WS-Addressing used in the message. The value from the current version is below for informational purposes:

```
http://schemas.xmlsoap.org/ws/2004/08/addressing/fault
```

The faults defined in this section are generated if the condition stated in the preamble is met. Fault handling rules are defined in section 4 of WS-Addressing.

The definitions of faults use the following properties:

[Code] The fault code.

[Subcode] The fault subcode.

[Reason] The English language reason element.

[Detail] The detail element. If absent, no detail element is defined for the fault.

The [Code] property MUST be either "Sender" or "Receiver". These properties are serialized into text XML as follows:

SOAP Version	Sender	Receiver
SOAP 1.1	`S11:Client`	`S11:Server`
SOAP 1.2	`S:Sender`	`S:Receiver`

The properties above bind to a SOAP 1.2 fault as follows:

```
<S:Envelope>
 <S:Header>
   <wsa:Action>
      http://schemas.xmlsoap.org/ws/2004/08/addressing/fault
   </wsa:Action>
   <!-- Headers elided for clarity.  -->
 </S:Header>
 <S:Body>
  <S:Fault>
   <S:Code>
     <S:Value> [Code] </S:Value>
     <S:Subcode>
      <S:Value> [Subcode] </S:Value>
     </S:Subcode>
   </S:Code>
   <S:Reason>
     <S:Text xml:lang="en"> [Reason] </S:Text>
   </S:Reason>
   <S:Detail>
     [Detail]
     ...
   </S:Detail>
  </S:Fault>
 </S:Body>
</S:Envelope>
```

The properties above bind to a SOAP 1.1 fault as follows when the fault is triggered by processing an RM header block:

```
<S11:Envelope>
 <S11:Header>
   <wsrm:SequenceFault>
     <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
     ...
   </wsrm:SequenceFault>
   <!-- Headers elided for clarity.  -->
 </S11:Header>
 <S11:Body>
```

```
  <S11:Fault>
   <faultcode> [Code] </faultcode>
   <faultstring> [Reason] </faultstring>
  </S11:Fault>
 </S11:Body>
</S11:Envelope>
```

The properties bind to a SOAP 1.1 fault as follows when the fault is generated as a result of processing a <CreateSequence> request message:

```
<S11:Envelope>
 <S11:Body>
  <S11:Fault>
   <faultcode> [Subcode] </faultcode>
   <faultstring xml:lang="en"> [Reason] </faultstring>
  </S11:Fault>
 </S11:Body>
</S11:Envelope>
```

4.1 SequenceFault Element

The purpose of the <SequenceFault> element is to carry the specific details of a fault generated during the reliable messaging specific processing of a message belonging to a Sequence. The <SequenceFault> container MUST only be used in conjunction with the SOAP1.1 fault mechanism. It MUST NOT be used in conjunction with the SOAP1.2 binding.

The following exemplar defines its syntax:

```
<wsrm:SequenceFault ...>
  <wsrm:FaultCode> wsrm:FaultCodes </wsrm:FaultCode>
  ...
</wsrm:SequenceFault>
```

The following describes the content model of the SequenceFault element.

/wsrm:SequenceFault
: This is the element containing Sequence information for WS-ReliableMessaging

/wsrm:SequenceFault/wsrm:FaultCode
: This element, if present, MUST contain a qualified name from the set of fault codes defined below.

/wsrm:SequenceFault/{any}
: This is an extensibility mechanism to allow different (extensible) types of information, based on a schema, to be passed.

/wsrm:SequenceFault/@{any}

This is an extensibility mechanism to allow additional attributes, based on schemas, to be added to the element.

4.2 Sequence Terminated

This fault is sent by either the RM Source or the RM Destination to indicate that the endpoint that generates the fault has either encountered an unrecoverable condition, or has detected a violation of the protocol and as a consequence, has chosen to terminate the sequence. The endpoint that generates this fault should make every reasonable effort to notify the corresponding endpoint of this decision.

Properties:

[Code] Sender or Receiver

[Subcode] wsrm:SequenceTerminated

[Reason] The Sequence has been terminated due to an unrecoverable error.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.3 Unknown Sequence

This fault is sent by either the RM Source or the RM Destination in response to a message containing an unknown sequence identifier.

Properties:

[Code] Sender

[Subcode] wsrm:UnknownSequence

[Reason] The value of wsrm:Identifier is not a known Sequence identifier.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.4 Invalid Acknowledgement

This fault is sent by the RM Source in response to a <SequenceAcknowledgement> that violates the cumulative acknowledgement invariant. An example of such a violation would be a SequenceAcknowledgement covering messages that have not been sent.

[Code] Sender

[Subcode] wsrm:InvalidAcknowledgement

[Reason] The SequenceAcknowledgement violates the cumulative acknowledgement invariant.

[Detail]

```
<wsrm:SequenceAcknowledgement ...> ... </wsrm:SequenceAcknowledgement>
```

4.5 Message Number Rollover

This fault is sent to indicate that message numbers for a sequence have been exhausted. It is an unrecoverable error and terminates the Sequence.

Properties:

[Code] Sender

[Subcode] wsrm:MessageNumberRollover

[Reason] The maximum value for wsrm:MessageNumber has been exceeded.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.6 Last Message Number Exceeded

This fault is sent by an RM Destination to indicate that it has received a message that has a <MessageNumber> within a Sequence that exceeds the value of the <MessageNumber> element that accompanied a <LastMessage> element for the Sequence. This is an unrecoverable error and terminates the Sequence.

Properties:

[Code] Sender

[Subcode] wsrm:LastMessageNumberExceeded

[Reason] The value for wsrm:MessageNumber exceeds the value of the MessageNumber accompanying a LastMessage element in this Sequence.

[Detail]

```
<wsrm:Identifier ...> xs:anyURI </wsrm:Identifier>
```

4.7 Create Sequence Refused

This fault is sent in response to a create sequence request that cannot be satisfied.

Properties:

[Code] Sender

[Subcode] wsrm:CreateSequenceRefused

[Reason] The create sequence request has been refused by the RM Destination.

[Detail] empty

5. Security Considerations

It is strongly recommended that the communication between services be secured using the mechanisms described in WS-Security. In order to properly secure messages, the body and all relevant headers need to be included in the signature. Specifically, the <wsrm:Sequence> header needs to be signed with the body in order to "bind" the two

together. The <wsrm:SequenceAcknowledgement> header may be signed independently because a reply independent of the message is not a security concern.

Because Sequences are expected to exchange a number of messages, it is recommended that a security context be established using the mechanisms described in WS-Trust and WS-SecureConversation. If a Sequence is bound to a specific endpoint, then the security context needs to be established or shared with the endpoint servicing the Sequence. While the context can be established at any time, it is critical that the messages establishing the Sequence be secured even if they precede security context establishment. However, it is recommended that the security context be established first. Security contexts are independent of reliable messaging Sequences. Consequently, security contexts can come and go independent of the lifetime of the Sequence. In fact, it is recommended that the lifetime of a security context be less than the lifetime of the Sequence unless the Sequence is very short-lived.

It is common for message Sequences to exchange a number of messages (or a large amount of data). As a result, the usage profile of a Sequence is such that it is susceptible to key attacks. For this reason it is strongly recommended that the keys be changed frequently. This "re-keying" can be effected a number of ways. The following list outlines four common techniques:

- Closing and re-establishing a security context
- Exchanging new secrets between the parties
- Using a derived key sequence and switch "generations"
- Attaching a nonce to each message and using it in a derived key function with the shared secret

The security context may be re-established using the mechanisms described in WS-Trust and WS-SecureConversation. Similarly, secrets can be exchanged using the mechanisms described in WS-Trust. Note, however, that the current shared secret should not be used to encrypt the new shared secret. Derived keys, the preferred solution from this list, can be specified using the mechanisms described in WS-SecureConversation.

There is a core tension between security and reliable messaging that can be problematic if not considered in implementations. That is, one aspect of security is to prevent message replay and the core tenet of reliable messaging is to replay messages until they are acknowledged. Consequently, if the security sub-system processes a message but a failure occurs before the reliable messaging sub-system records the message (or the message is considered "processed"), then it is possible (and likely) that the security sub-system will treat subsequent copies as replays and discard them. At the same time, the reliable messaging sub-system will likely continue to expect and even solicit the missing message(s). Care should be taken to avoid and prevent this race condition.

The following list summarizes common classes of attacks that apply to this protocol and identifies the mechanism to prevent/mitigate the attacks:

- **Message alteration** – Alteration is prevented by including signatures of the message information using WS-Security.
- **Message disclosure** – Confidentiality is preserved by encrypting sensitive data using WS-Security.

- **Key integrity** – Key integrity is maintained by using the strongest algorithms possible (by comparing secured policies – see WS-Policy and WS-SecurityPolicy).
- **Authentication** – Authentication is established using the mechanisms described in WS-Security and WS-Trust. Each message is authenticated using the mechanisms described in WS-Security.
- **Accountability** – Accountability is a function of the type of and string of the key and algorithms being used. In many cases, a strong symmetric key provides sufficient accountability. However, in some environments, strong PKI signatures are required.
- **Availability** – All reliable messaging services are subject to a variety of availability attacks. Replay detection is a common attack and it is recommended that this be addressed by the mechanisms described in WS-Security. (Note that because of legitimate message replays, detection should include a differentiator besides message id such as a timestamp). Other attacks, such as network-level denial of service attacks are harder to avoid and are outside the scope of this specification. That said, care should be taken to ensure that minimal state is saved prior to any authenticating sequences.

    </wsrm:CreateSequenceResponse>
  </S:Body>
</S:Envelope>
```

B.2 Initial Transmission

The following example WS-ReliableMessaging headers illustrate the message exchange in the above figure. The three messages have the following headers; the third message is identified as the last message in the sequence:

Message 1

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
  <S:Header>
    <wsa:MessageID>
      http://Business456.com/guid/71e0654e-5ce8-477b-bb9d-34f05cfcbc9e
    </wsa:MessageID>
    <wsa:To>http://fabrikam123.com/serviceB/123</wsa:To>
    <wsa:From>
      <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
    </wsa:From>
    <wsa:Action>http://fabrikam123.com/serviceB/123/request</wsa:Action>
    <wsrm:Sequence>
      <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
      <wsrm:MessageNumber>1</wsrm:MessageNumber>
    </wsrm:Sequence>
  </S:Header>
  <S:Body>
    <!--  Some  Application  Data  -->
  </S:Body>
</S:Envelope>
```

Message 2

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
```

```
  <S:Header>
    <wsa:MessageID>
      http://Business456.com/guid/daa7d0b2-c8e0-476e-a9a4-d164154e38de

   <wsrm:MessageNumber>3</wsrm:MessageNumber>
   <wsrm:LastMessage/>
```

```
  </wsrm:Sequence>
 </S:Header>
 <S:Body>
  <!-- Some Application Data -->
 </S:Body>
</S:Envelope>
```

B.3 First Acknowledgement

Message number 2 has not been received by the RM Destination due to some transmission error so it responds with an acknowledgement for messages 1 and 3:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://fabrikam123.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546810
  </wsa:MessageID>
  <wsa:To>http://Business456.com/serviceA/789</wsa:To>
  <wsa:From>
   <wsa:Address>http://fabrikam123.com/serviceB/123</wsa:Address>
  </wsa:From>
  <wsa:Action>
    http://schemas.xmlsoap.org/ws/2005/02/rm/SequenceAcknowledgement
  </wsa:Action>
  <wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:AcknowledgementRange Upper="1" Lower="1"/>
   <wsrm:AcknowledgementRange Upper="3" Lower="3"/>
  </wsrm:SequenceAcknowledgement>
 </S:Header>
 <S:Body/>
</S:Envelope>
```

B.4 Retransmission

The sending endpoint discovers that message number 2 was not received so it resends the message and requests an acknowledgement:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://Business456.com/guid/daa7d0b2-c8e0-476e-a9a4-d164154e38de
  </wsa:MessageID>
  <wsa:To>http://fabrikam123.com/serviceB/123</wsa:To>
  <wsa:From>
   <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
  </wsa:From>
  <wsa:Action>http://fabrikam123.com/serviceB/123/request</wsa:Action>
  <wsrm:Sequence>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:MessageNumber>2</wsrm:MessageNumber>
  </wsrm:Sequence>
  <wsrm:AckRequested>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
  </wsrm:AckRequested>
 </S:Header>
 <S:Body>
  <!-- Some Application Data -->
 </S:Body>
</S:Envelope>
```

B.5 Termination

The RM Destination now responds with an acknowledgement for the complete sequence which can then be terminated:

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://fabrikam123.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546811
```

```
  </wsa:MessageID>
  <wsa:To>http://Business456.com/serviceA/789</wsa:To>
  <wsa:From>
   <wsa:Address>http://fabrikam123.com/serviceB/123</wsa:Address>
  </wsa:From>
  <wsa:Action>
    http://schemas.xmlsoap.org/ws/2005/02/rm/SequenceAcknowledgement
  </wsa:Action>
  <wsrm:SequenceAcknowledgement>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
   <wsrm:AcknowledgementRange Upper="3" Lower="1"/>
  </wsrm:SequenceAcknowledgement>
 </S:Header>
 <S:Body/>
</S:Envelope>
```

Terminate Sequence

```
<?xml version="1.0" encoding="UTF-8"?>
<S:Envelope xmlns:S="http://www.w3.org/2003/05/soap-envelope"
xmlns:wsrm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing">
 <S:Header>
  <wsa:MessageID>
   http://Business456.com/guid/0baaf88d-483b-4ecf-a6d8-a7c2eb546812
  </wsa:MessageID>
  <wsa:To>http://fabrikam123.com/serviceB/123</wsa:To>
  <wsa:Action>
    http://schemas.xmlsoap.org/ws/2005/02/rm/TerminateSequence
  </wsa:Action>
  <wsa:From>
   <wsa:Address>http://Business456.com/serviceA/789</wsa:Address>
  </wsa:From>
 </S:Header>
 <S:Body>
  <wsrm:TerminateSequence>
   <wsrm:Identifier>http://Business456.com/RM/ABC</wsrm:Identifier>
  </wsrm:TerminateSequence>
```

```
 </S:Body>
</S:Envelope>
```

Appendix C WSDL

The non-normative WSDL definition for WS-ReliableMessaging is located at:

```
http://schemas.xmlsoap.org/ws/2005/02/rm/wsdl/wsrm.wsdl
```

The following non-normative copy is provided for reference.

```
<wsdl:definitions xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing"
xmlns:rm="http://schemas.xmlsoap.org/ws/2005/02/rm"
xmlns:tns="http://schemas.xmlsoap.org/ws/2005/02/rm/wsdl"
targetNamespace="http://schemas.xmlsoap.org/ws/2005/02/rm/wsdl">
<wsdl:types>
    <xs:schema>
      <xs:import namespace="http://schemas.xmlsoap.org/ws/2005/02/rm"
schemaLocation="http://schemas.xmlsoap.org/ws/2005/02/rm/wsrm.xsd"/>
      <xs:import
